

WERS For Film Fact Sheet.

Window film and energy

- Solar control window film can mean a 30% saving in cooling air conditioning usage, equating to about 10 - 15% reduction in a home's annual electricity costs
- Window film's primary purpose is solar energy rejection, rejecting as much as 81% - equal to the highest performing glass
- To help your home stay warm during winter, films are available with heat retention properties, that still allow sunshine into the home so you get the benefit of 'passive solar heat gain'
- Window film offers more value than any other window energy rejecting product like performance glass, blinds or external shades

WERS For Film

- WERS stands for the Window Energy Rating Scheme, the energy-rating program for the window industry endorsed by the Association of Building Sustainability Assessors
- Using WERS For Film ratings, you can now accurately and confidently compare the energy benefits of different window films to select the one that best suits your needs
- Products that have been rated in the WERS For Film program have a star rating for heating and cooling
- Like the energy star system used to rate whitegoods, the more stars the greater the efficiency of the product
- When a WERS-rated film is applied by a WERS For Film Accredited Individual, a WERS For Film certificate can be issued and given to you at the conclusion of the project
- For the certificate to be valid, the installer must be a current WERS For Film Accredited Individual - visit www.wfaanz.org.au/WERSLicencees to ensure your installer is certified
- When you want to sell your home or conduct an energy assessment, the WERS certificate will be used by the certifier or assessor
- Using a WERS rated film and having a WERS certificate will improve your energy rating, which will increase the value of your home or building and make it more appealing to prospective buyers

To check that your installer is certified, visit www.wfaanz.org.au/werslicencees.
